EVENT MAP

Here's a challenge for all you data enthusiasts!

We are hosting our first ever 24-hour virtual hackathon to coincide with our 10th year anniversary celebrations. Are you ready to take on our big data in the cloud challenge, and show us how you can process over 4 billion events in the cloud?

The Challenge

In a future where your whole life is connected, all your devices will report to you in real time; what they are doing, the resources they are consuming, how they are responding to real time events, etc. Take several smart plugs with sensors, deploy them across a few private households and you will have an uncountable number of connected devices, processing an unimaginable amount of data that help us gain insights into how to advance our lives.

This future is possible today, and your challenge is to make it happen NOW.

You must:

- Build a scalable solution that can process up to 4 billion events within a short period of time
-Configure and build your solution within 24 hours in the cloud, and run on Apache Stratos
-The solution should come together with testing documentation, and complete 2 queries

More details about the event can be found at:
http://virtual15.wso2hackathon.com/
