Welcome to the Microsoft Advanced Threat Analytics blog!

Microsoft Advanced Threat Analytics Team **27 Aug 2015 11:25 AM**   **0**

We know how much pain cyber-security attacks are causing you. At Microsoft, our goal is to innovate and help you protect your organization from these advanced attacks. This is why, back in May, at our Ignite conference, we previewed a new, innovative cyber-security solution: Microsoft Advanced Threat Analytics (ATA). ATA is designed to help you detect advanced targeted attacks with User and Entity Behavioral Analytics (UEBA).

Since the preview announcement, we have seen significant interest with thousands of companies downloading and trying the evaluation bits. We have added several capabilities since then and now we are at the finish line. ATA is available now!

Now is the time! You can download our GA evaluation bits and implement ATA in your organization. If you have any questions or suggestions, send it our way. We have a discussion forum where you can post these questions and feedback. We will respond to you as quickly as possible!

Going forward, we will share product updates and cyber-security insights at this blog. If you are interested, subscribe to our RSS feed to learn more about ATA and the changing nature of cyber-security attacks.

Thanks!

Microsoft Advanced Threat Analytics team
